

PROSPECT FOR THE DEVELOPMENT OF THE FIELD OF EDUCATION AND  
SCIENCE IN THE NEW DEVELOPMENT PERIOD OF UZBEKISTAN

Hamidova Barchin Komilovna

*\\Psychologist of the 62 nd school of Ishtikhan district*

**Abstract:** *This article analyzes the innovations in the education system in Uzbekistan, as well as the implementation of democratic reforms in Uzbekistan, the development of scientific fields.*

**Keywords:** *Progress, education system, education quality, law, modern technologies*

Progress is a form of development from simple to complex, from bottom to top, its rise. In the literature, progress is often confused with development, which is actually a direction of development. Also, in some literature, development is used only in the sense of development in society, which is also a one-sided approach. Development is used in philosophical literature as progressive development. Usually there are 2 important directions of development, one is called Progress (progressive development) and the other is Crisis (regressive development). The mistake of applying progress only to society is that progress also occurs in systems outside of society.

Today, New Uzbekistan, setting great goals and goals, is taking a bold step towards achieving the standard of living among developed countries in the world, and building a fair, free and prosperous society. Of course, we will not achieve this goal by ourselves. For this, first of all, it is necessary to have a mature and thorough program that serves the near, medium and long perspective of the state. Then, in order to fully implement this program, the whole nation, every compatriot living on this land, all of us will have to work together and work effectively. "Development Strategy of New Uzbekistan" is our similar program.

President of the Republic of Uzbekistan on February 7, 2017 social sphere in the decree on the strategy of actions for the development of in particular, a number of tasks related to the improvement of the fields of education and science defined.

After all, the education system is in the direction of healthy humanism reorganization, raising it to the level of modern students, mature, spiritual It is a country where the education of morally pure people cannot be delayed is an important task. In the document, strengthening the material and technical base of educational institutions, construction of new educational institutions, reconstruction of existing ones and capital during the repair, they will be equipped with modern educational and laboratory equipment, a computer 2017-2021 development of a program for radical improvement of the higher education system in further modernization of programs, provision of paid services and of higher education institutions in search of additional sources of funding their independence gradually by expanding their powers is being developed.

Our country "Improving the educational system" adopted on November 6, 2020 Decision on additional measures to improve higher education to organize the activities of institutions at the level of world standards, to make them modern it is important to provide textbooks, educational manuals, and scientific laboratories program is in effect. Providing

modern education to the young generation at the level of world requirements, advanced introduction of teaching methods, establishment of new educational institutions, in short, to raise the growing young generation to maturity is the ultimate goal of today's reforms. Moreover, today training, retraining and experience of qualified professors it is vital to raise and ultimately educate the young generation to become mature in all aspects became a necessity.

It is known that the development strategy of New Uzbekistan for 2022-2026, which was developed by the Decree of the President of the Republic of Uzbekistan on January 28, 2022, based on the principle "From the strategy of actions to the strategy of development" The state program for the implementation of the "neighborhood year" was approved.

The development strategy is designed for 2022-2026 and envisages the implementation of the noble idea "For human dignity". This program was formed on the basis of consultation with the general public, opinions and suggestions of our compatriots.

The strategy of development is essentially populist and historical, in which directions and mechanisms leading to 100 goals aimed at glorifying human dignity are clearly defined. It identified 7 priority directions: Within these priorities,

398 measures aimed at achieving 100 goals and to be implemented in 2022 were envisaged.

As we all know, as a result of the last five years of reforms, the necessary political-legal, socio-economic and scientific-educational foundations for the establishment of New Uzbekistan were created in our country. In particular, as part of the Action Strategy, fundamental reforms were implemented in the reform of the higher education system, as well as in all stages of the education sector. As a result, the level of coverage of young people with higher education increased from

9 percent to 28 percent in 2016-2021. Through the Development Strategy of New Uzbekistan for 2022-2026, it is aimed to increase this indicator to 38% by the end of 2022, and to 50% by 2026.

As a result, wide opportunities will be created for thousands of our young people who want to get higher education.

In fact, in the 4th direction of the New Uzbekistan Development Strategy, which includes 34 goals and 59 measures, entitled "Conducting fair social policy, development of human capital", a number of targeted tasks in the field of education have been defined. Great achievements have been made in the development of the higher education system, which is one of the main links of the foundation of the Third Renaissance.

It is impossible not to recognize separately, the establishment of private higher education institutions in each region and the establishment of 50 private universities by 2026 is also envisaged. Another issue is that even in developed countries, full provision of accommodation for students is a serious issue. The significant increase in the number of students studying in higher education in our country in recent years has made the issue of providing accommodation for these young people urgent. Of course, it is impossible to provide accommodation to all students at once. However, we can see that special attention is paid to the solution of this issue in the Development Strategy. In particular, as a result of the completion of 47 student residences in 2022, the construction of 181 student residences

with 72,400 beds by 2026, the level of providing students with dormitories is set to increase from 60 percent.

The period of knowledge and professional skills of pedagogues in improving the quality of education compliance with the requirements, innovative educational technologies in teaching its use, effectiveness of organized lessons, the learner is good Pedagogical and information technologies of each subject for mastering it is required to ensure its passage using Competency in teaching implementation of approach-based education in students one of the urgent tasks is to be able to apply the acquired knowledge in life, choose a profession, get independent education, and develop learning competencies.

Modernization of the education system in our republic today, introduction of innovative teaching technologies, independence, creativity, training of young people with professional qualities such as initiative and entrepreneurship. In order to encourage pedagogues, important and meritorious works have been carried out is increasing.

By eliminating such shortcomings as above, we have modern education we achieve the creation of programs. To do this, perform the following tasks I think it is necessary to increase:

Firstly, the relevance of the subject taught in the introductory part of the science program and reveal its importance, its goals and objectives, what it needs in the future special attention should be paid. This is done by life examples related to science, science and taking into account the progress being made in the fields of technology and production it would be appropriate if it were clarified. This is definitely a science for students to awaken the initial motivation, confidence in the future helps the formation of buds.

Secondly, today there are great changes in the socio-economic spheres is happening. A lot of new equipment and technologies from abroad to our republic, investments are coming in, besides, we are also producing, new enterprises and production organizations are being established. Of course tomorrow they need a specialist who can work independently and manage them. That's why for today we are preparing them for the future clear, correct, out of order of the modern qualification requirements set by if necessary, learning without doing work in the style of "it left us - reached the owner". Go to these enterprises and organizations and see with your own eyes, their leaders and experienced should be formed in cooperation with specialists. Then these ready-made qualification requirements should be reflected in the curriculum.

Eliminating existing deficiencies and problems in improving the quality of education clearly defining the goals and tasks on the way, for this it is recognized in the world use of experiences, information technologies with pedagogical technologies professional training of future specialists to use in harmony serves to improve the quality, it increases the efficiency of the process. Education used in the processes of clarifying goals, teaching and mastering using different technologies and methods, focusing on the content of education will lead to the development and improvement of the activities of institutions.
