THE ROLE OF ONLINE LEARNING IN EDUCATION

Nozima Yusupova Akbarovna
Student, Samarkand State Institute of Foreign Language

Abstract: *The purpose of this study is to improve the study efficiency among students to save their personal time, with the help of online courses, to study self-efficacy and behavior. The importance of online education in the education system is extremely high. The particular reason for circumstance most people want to study several fields at the same time. Online learning courses are convenient, low price and comfortable time. People can choose the time of these courses according to their wishes. The additional reason for the research is to find out what factors affect the students' participation and engagement to peer learning in the university's online course.*

Keywords: *online learning, online courses, convenient of online learning, learner control, readiness for online learning*

INTRODUCTION

Today we use a number of digital tools. Currently, due to lack of time or lack of rooms in some universities we may need online courses. Or some students, even middle ages are using many online courses. Because, these courses save time. We can use these online courses anywhere and anytime. It is extremely heavy to imagine our life style without modern devices, the internet and of online courses . "This theme is especially crucial as it has been related to engagement and retention in online education environments (Joosten and Cusatis,2020). Today, the intellectual potential of society is directly dependent on the education system. Education in this way is a new form of modern education. In this kind of education, listeners, that is, students or teachers, do not always have to go to school or university. Anyone can use it. For example, seriously ill people, disabled people, even those who live far away from such centers.

Why is online education important ?

Advantages and disadvantages of online learning ?

Since the pandemic online learning has become more popular and has given students or users the opportunity to attend online lessons of their choice from anywhere. These lessons have some advantages and disadvantages. If we consider about the positives of this situation many people will save money and time spent on the road. In addition, students can save online lessons, when they do not understant part of lesson. Or some can not speak in front of many people in traditional classes. Such courses you can work one-on-one. Certainly, we must also remember the negative aspects. There atmosphere between the

teacher and the student is somewhat different the student may not fully understand to the responsibility. Or there may be some internet related issues and some harmful rays from the screen can harm to health.

Readiness for online learning, as described in previous studies, encompasses multiple aspects. This process involves comfort with e-learning and the effective use of learning materials, as well as ability to independently manage one's learning. Together, these two factors play a crucial role in achieving success in online education (Smith et al., 2003). Pillay et al. (2007) identified online education readiness as a concept that involves aspects such as technical skills, self-efficacy with computer, learning inclination, and attitudes towards technology. Hung et al. (2010) created a system to assess readiness for online education, which includes self-directed study, motivation, confidence in using computers and the internet, learner control, and ability to communication online.

Online learning has significantly changed the education system in recent times. These changes in the field of education are certainly not surprising in today's advanced age, where our day does not pass without modern technologies. Distance learning is independent work. This further develops a person's self-esteem and thinking. Many people study and work in this form of education. This will greatly improve the financial condition of a person. When it comes to distance education, we need to remember one more thing. In traditional reading, lessons are often taught in large groups. Someone moves faster and someone moves slower. And this affects the quality of the lesson. In distance, the teacher works with a single person.

Learner control

If a person wants to study online and not in the traditional education system, he must be able to control himself. Because it is much more difficult to achieve high results in irregular education. For example, it is necessary for the student to complete the tasks given by the teacher chosen by him, that is, on time, and also learn other, unplanned manuals. The teacher must also develop his own specially designed, perfect plan. Because nothing should remain abstract for the learner.

Conclusion: Today, the education system cannot be imagined without online learning. It has become an integral part of the system. This form of education provides several conveniences for teachers and students. As digital technologies advance, so does the need for online education. This form of education is very important in schools and universities. It provides students with convenient access to various learning platforms. This type of training is more efficient and cost-effective than traditional classes. Besides, it saves people's time.
